FOREWORD

This report was prepared by the Lockheed-California Company under contract DOT-FA75-WA-3707. The report contains a partial description of the effort performed as Task II of a three task effort. Task II covers the period from January 1978 to November 1978. The work was administered under the direction of the Federal Aviation Administration with H. Spicer as Technical Monitor.

The project leader was Gil Wittlin, of the Lockheed-California Company. Important contributions were made to the program by the Cessna Aircraft Company under the direction of D.J. Ahrens and W.B. Bloedel. W.L. LaBarge, of the Lockheed-California Company, prepared the Programmer's Manual with the assistance of G. Wittlin, M.S. Camon, H. Weinberger and D. Seiki.

The Lockheed effort was performed under the supervision of J.E. Wignot (Dynamic Loads Group).

SUMMARY

This document contains a description of program KRASH as modified under contract DOT-FA75-WA-3707. Included in the Programmer's Manual are the following sections:

- Program KRASH System Requirements
- Input Data Deck
- Demonstration Problem

This Programmer's Manual is one of a series of operational documents for program KRASH. In this manual, pertinent information is supplied which will facilitate bringing the program to an operational status on the user's computer system. This manual has been established in such a manner that it can be updated as more data becomes available. The subject material contained within each section can be expanded or revised, as necessary, without affecting the other sections. Each section contains its own numbering system which facilitates the task of updating the document.

SECTION 1

INTRODUCTION

Program KRASH is a digital computer program which predicts the structural response of vehicles to multidirectional crash environments. The program computes the time histories of N interconnected masses, each allowed six degrees of freedom, defined by internal coordinates X_i , Y_i , Z_i and Eulerian angles ϕ_i , θ_i , χ_i , when $i = 1, 2, \dots, N$. Euler's equations of motion are written for each mass. The equations of motion are integrated numerically to obtain velocities, displacements, and rotations. Gravitational forces, internal forces and moments, and external forces are computed. For small deflections, a linear analysis is obtained, and for large deflections, general plastic deformation is allowed. The program provides for unloading and subsequent reloading along a linear elastic line.

Program KRASH describes the interaction between a series of massless interconnecting structural elements and concentrated rigid body masses to which the structural elements are attached at their ends with the appropriate end fixity (pinned, fixed). The structural elements can be connected between node points which are offset from, and rigidly attached to, selected mass points. The interconnecting elements represent the stiffness characteristics of the structure between the masses. The masses can translate and rotate in all directions under the influence of the external forces (i.e., gravity, aerodynamic, impact), as well as the constraining internal element forces. The movement of the masses results in changes in the relative distortion of the structural elements and, in turn, results in a new set of element forces acting throughout the system.

Computer Program KRASH has the capability to:

- Define the response of six degrees of freedom (DOF) at each representative location, including three translations and three rotations.
- Determine mass accelerations, velocities, and displacements and internal member loads and deformations at each time interval.
- Provide for general nonlinear stiffness properties in the plastic regime, including different types of load-limiting devices, and determine the amount of permanent deformation.
- Define how and when rupture of an element takes place and redistribute the loading over the structural elements involved.
- Define mass penetration into an occupiable volume.
- Define the volume change due to structural deformations of an occupiable volume.
- Provide for ground contact by external structure including sliding friction and a nonrigid ground surface.
- Include internal structural damping.
- Include a measure of injury potential to the occupants; for instance, the probability of spinal injury indicated by the Dynamic Response Index (DRI).
- Determine the distribution of kinetic and potential energy by mass item, the distribution of strain and damping energy by beam element, and the crushing and sliding friction energy associated with each external spring.
- Determine the vehicle response to an initial condition that includes linear and angular velocity about three axes and any arbitrary vehicle attitude and position.
- Provide a measure of the airplane cg velocity by means of translational momentum relationships.
- Analyze an impact into a horizontal ground and/or an inclined slope.
- Provide a measure of the internal stress state of internal beam elements.
- Analyze a mathematical model containing up to 80 masses and 150 internal beam elements.
- Treat up to 180 nonlinear element degrees of freedom.

A comprehensive discussion of the theoretical development of program KRASH is presented in Reference (1). A discussion of program KRASH input-output formats as well as modeling techniques and applications are included in Reference (2). Reference (3) provides a discussion of design guidelines which can be used in conjunction with program KRASH in the structural crash-worthiness analysis of general aviation airplanes.

The last in the series of operational documentation for program KRASH is this Programmer's Manual. In this manual, pertinent information is supplied which will facilitate bringing the program to an operational status on the user's computer system. The manual contains a discussion of the program's system requirements, functional organization, and a demonstration problem which can be used to verify the operation of the program.

SECTION 2

PROGRAM KRASH SYSTEM REQUIREMENTS

The basic control card deck consists of the necessary job control cards, the program KRASH source cards, and the data input card deck. Here, "card deck" and "cards" are to be interpreted in their broadest sense. They include any medium by which instructions are transmitted to the computing system, e.g., physical cards, tape, remote terminal instructions, etc.

2.1 JOB CONTROL DECK

Due to the wide variety of computer systems available and individual computer installation requirements, a complete and detailed listing of all possible job control language (JCL) cards is not feasible. Format details of the JCL instructions will have to satisfy the requirements of the specific computing system in use. Irrespective of the details, the JCL cards must provide for the following program KRASH requirements:

- Using the overlay structure illustrated in Figure 2-1, a core space equivalent to 600K bytes of IBM 360 core. (Note that the IBM 360 is a 32-bit word machine with 4 bytes per word).
- The temporary logical data storage units discussed in Section 2.2.
- A permanent data storage unit. See Section 2.2.
- The compile and link instructions necessary to execute a FORTRAN IV source deck. For the examples shown in this manual, a FORTRAN H compiler (level 21.8) with an optimization level of 2 (OPT 22) has been used.

2.2 LOGICAL UNITS

Calls to the eleven logical storage units listed in Table 2-1 can be made from program KRASH. Of the units listed, all but units 5, 6, and 21 are

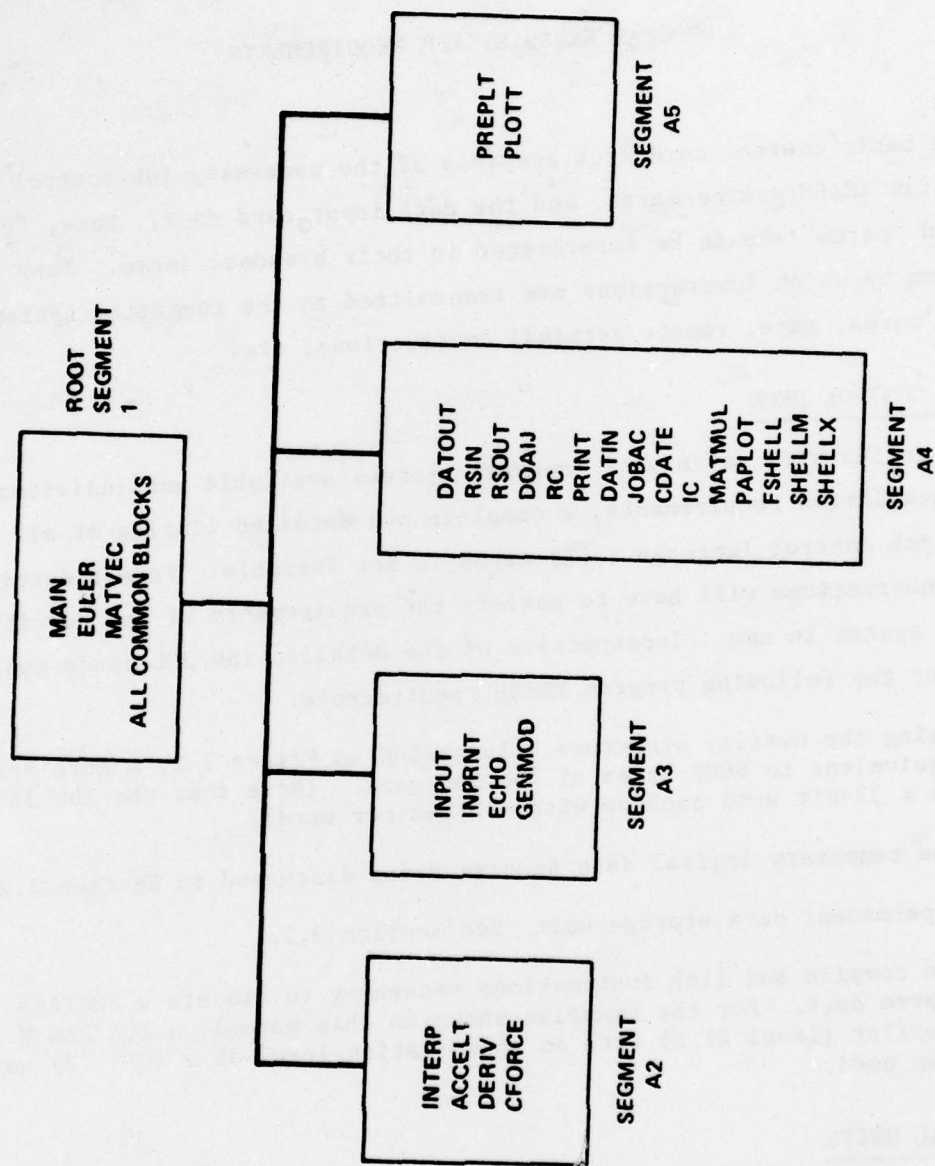

Figure 2-1. Overlay Map

(2) Reserved for future use			
(3) Tape storage unit used for permanent storage			

considered temporary data storage devices. Of the temporary units, unit 10 is required for each run. The remaining temporary units are required only when summary plots are requested. See Section 2.1 of Reference (2). Units 5 and 6 are standard stored input and output units. Unit 21 is a permanent data storage unit and is called whenever the restart option is exercised (see Section 3.3).

2.3 INPUT DATA DECK

The input data required to run program KRASH consists of a series of cards which control the operation of the program, set the initial conditions of the analyses, and define the structural characteristics of the model. A complete description of the cards which make up this deck is presented in Section 2 of Reference (2). All of the data supplied on the cards of this deck are read from unit 5.

Special attention is directed to cards 5 and 6 of the input data deck of program KRASH. See Figure 2-1 of reference (2). The data supplied on these cards are used when the restart option is exercised. The restart option requires a check point run to be made during which state vector data are saved on unit 21 at specified times. In subsequent runs the data can be retrieved from unit 21 and the program restarted at any one of the times used in the check point run. A description of the data management details related to the storage and retrieval of these data is presented in Section 3.3.

2.4 RUNNING PROGRAM KRASH

2.4.1 Program KRASH Execution

Figure 2-2 presents a copy of the program deck used at the Lockheed California Company to compile, link, and execute program KRASH. The program deck assumes that program KRASH source is on an unlabeled 9-track tape with card image records (i.e. RECFM = F, LRECL = 80, BLKSIZE = 80); note that this is the standard format of the KRASH source tape as released by the Lockheed California Company. If the program KRASH source is on cards, then changes to the example program deck will be necessary to reflect this fact.

2.4.2 Restart Tape Initiation

Before the restart option of program KRASH can be exercised, a save tape must be reserved and initialized as described in Section 3.3. The program deck shown in Figure 2-3 has been used at the Lockheed California Company to initialize a restart tape. The tape in the example is an IBM Standard Label tape.

SECTION 3

PROGRAM KRASH FUNCTIONAL ORGANIZATION

Program KRASH is divided into three basic functional blocks: computational analysis and data processing; internal data storage and transfer; and external data storage and retrieval. Each of these blocks is discussed in the following sections of this manual.

3.1 COMPUTATIONAL ANALYSIS AND DATA PROCESSING

The computational analysis and processing of data is accomplished by program KRASH as illustrated in the flow chart shown in Figure 3-1. The rectangular blocks represent calls to functional subroutines. All other blocks represent functional operations and logical branching controlled within the MAIN segment of the program.

3.1.1 Subroutine Call Cross Reference

Calls to various subroutines are made throughout program KRASH. A cross-reference map identifying the calling routine or subroutine and the called subroutine is shown in Table 3-1. Included in the map are the IBM 360 core requirements for each of the routines listed. Attention is drawn to the fact that these size requirements are applicable only when the H version (OPT = 2) of the FORTRAN compiler is used. The use of other compiler versions or options will result in different size requirements.

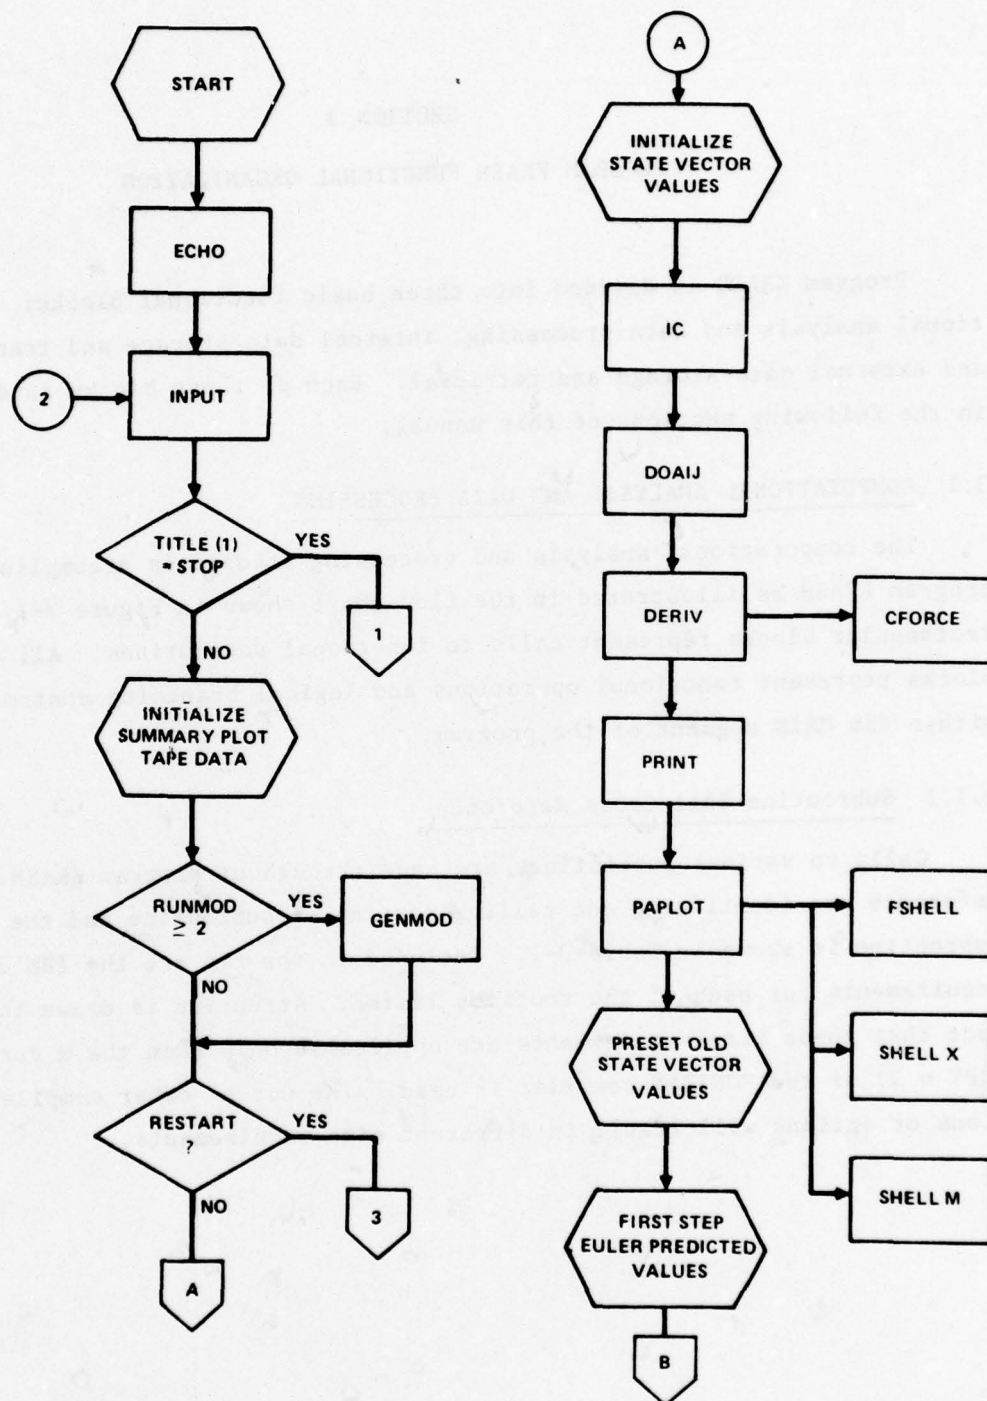

Figure 3-1. KRASH Flow Chart (Sheet 1 of 3)

3.1.2 Subroutine Functional Description

Described in this section are the functional operations of each subroutine along with definitions of the symbols which compose the subroutine call statement argument list. When possible these symbols are referenced to the corresponding symbols used in the theoretical development presented in Reference (1).

3.1.2.1 MAIN

The MAIN segment of program KRASH serves primarily as a control routine for the program. Processing of data is controlled by calls to the various functional subroutines included in the program. In addition to the above, the MAIN segment contains the predictor-corrector numerical integration algorithm used by program KRASH. The predictor-corrector method used is discussed in detail in Section 1.3.13 of Reference (1). At the end of each run, MAIN controls the printing of various summary data which recap the significant events of the run. Examples of these summaries are shown in Figure 3.2.

Comment cards are included in the MAIN source deck which refer to RUNMOD options 3 and 4. These options are not discussed in the User's Manual, Reference (2), and are not intended for production use at this time. Option 3 is set aside for future use as a model data card punch option. Option 4 is an option which has been set up to aid in the debugging of the program during its development.

A number of energy error checks are controlled from MAIN, see Section 3.4. When any of these checks fail, control is passed to the summary print section of MAIN for execution and subsequent run termination.

NOTE: INITIAL DEFLECTION IS FIRST IMPACT IF HYPE=1, OTHERWISE IT IS POINT AT WHICH RELOADING OCCUR FOR HYPE=0

Figure 3-2 Example End of Run Summary Tables

3.1.2.2 EULER

Subroutine EULER generates the transformation matrix defined by equation 1-2 of Reference (1). The angles PHI, THETA and PSI are used to form the nine elements of transformation matrix A. The elements of the matrix are returned to the calling routine via the argument list.

CALLING STATEMENT ARGUMENT LIST			
Mnemonic	Symbol Ref. (1)	Type	
A	A	R*8	Transformation matrix } Euler angles defined by equation 1-2, Reference (1)
PHI	ϕ	R*8	
THETA	θ	R*8	
PSI	ψ	R*8	

3.1.2.3 MATVEC

Subroutine MATVEC performs the vector matrix multiplication $\overline{A*V}$ if ISW is equal to zero, otherwise the vector matrix multiplication $\overline{A^T*V}$ is performed. The product of the multiplication is returned to the calling subroutine by P.

CALLING STATEMENT ARGUMENT LIST			
Mnemonic	Symbol Ref. (1)	Type	
A		R*8	Insert matrix
V		R*8	Input matrix
P		R*8	Resulting output matrix
ISW		I*4	Transposition flag

A blank in the symbol (Reference(1)) column indicates that there is no equivalent symbol defined in the KRASH theory which can be directly related to the particular Mnemonic term.

3.1.2.4 ACCELT

Subroutine ACCELT enters the acceleration input table stored in the common region named INAC. Appropriate levels are extracted from the table based on the time parameter TIME. These levels are passed to the subroutine INTERP for interpolation. The interpolated values are returned to the calling routine by X1, YC, ZC, A1, A2, and A3. The counters NPTSP and NPTS are set equal to zero each time through DERIV.

CALLING STATEMENT ARGUMENT LIST			
Mnemonic	Symbol Ref. (1)	Type	
MASDEX		I*4	Mass number
X1	\dot{u}	R*8	$\left. \begin{array}{l} \text{Time derivative} \\ \text{of translational} \\ \text{velocity along} \end{array} \right\} \begin{Bmatrix} X \\ Y \\ Z \end{Bmatrix} \text{ axis}$
YC	\dot{v}	R*8	
ZC	\dot{w}	R*8	
A1	\dot{p}	R*8	$\left. \begin{array}{l} \text{Time derivative} \\ \text{of rotational} \\ \text{velocity about} \end{array} \right\} \begin{Bmatrix} X \\ Y \\ Z \end{Bmatrix} \text{ axis}$
A2	\dot{q}	R*8	
A3	\dot{r}	R*8	
TIME	t	R*8	Integration time step
NPTSP		I*4	counter, previous
NPTS		I*4	counter, current

3.1.2.5 INTERP

Subroutine INTERP interpolates between tabulated acceleration values for the acceleration at time TT. A trapazoidal interpolation scheme is used.

CALLING STATEMENT ARGUMENT LIST			
Mnemonic	Symbol Ref. (1)	Type	
IREF		I*4	Acceleration table acceleration values
TT	t	R*8	Integration time value
YOUT		R*8	Interpolated acceleration value

3.1.2.6 DERIV

In subroutine DERIV the equations of motion associated with each mass element are formed. The terms included in the equations are based on the linear and nonlinear stiffness characteristics and the damping properties of the beam elements, Section 1.3.5.3, Reference (1); the external aerodynamic forces acting on the vehicle, Section 1.3.5.2, Reference (1); the external spring forces acting on the vehicle, Section 1.3.5.4, Reference (1); and inertia properties of the mass elements. The equations of motion are integrated numerically, Section 1.3.13, Reference (1), to determine the incremental displacement, velocity, and acceleration of each mass element.

External spring forces and deflections are supplied to DERIV by a call to subroutine CFORCE. Subroutine ACCEL is called only when the input option to supply time-history tables for mass accelerations is exercised. All data input and output to DERIV is accomplished through the various common block regions specified in the subroutines.

3.1.2.7 CFORCE

In subroutine CFORCE the computations corresponding to the theoretical analyses discussed in Section 1.3.5.4, Reference (1), are carried out. The deflections of the external springs which are in contact with the ground plane are determined. Based on these deflections, the force acting along the axis of each spring is determined. The component of this force acting perpendicular to the ground plane is combined with the friction coefficient supplied in the input data to give the drag force acting on the spring. The force in the spring and the drag force are resolved into forces and moments acting on the mass element to which the spring is attached. These forces and moments are returned to DERIV, the calling subroutine, through the various common block regions included in the subroutines.

3.1.2.8 INPUT

Subroutine INPUT reads all input card data. The data are processed and stored in appropriate common block regions. A detailed description of all input data required by program KRASH is presented in Reference (2).

3.1.2.9 INPRNT

Subroutine INPRNT processes and prints data supplied by subroutine INPUT and when appropriate, subroutine GENMOD. The data is supplied through the various common block regions included in the subroutine. The data printed by this subroutine are discussed in detail in Reference (2) and an example listing of the data is shown in Figure 3-3.

3.1.2.10 ECHO

Subroutine ECHO prints a complete listing of the input data in card image format. An example of this output is shown in Figure 3-4.

3.1.2.11 GENMOD

Subroutine GENMOD generates the necessary input data to expand a half airplane model representation into a full airplane model representation. This subroutine is called only when the RUNMOD flag is set equal to or greater than 2. The various common block regions included in GENMOD are used for the input and output of data.

3.1.2.12 RSOUT

In subroutine RSOUT all state vector data are processed for subsequent output through calls to subroutine DATOUT. RSOUT is called only when one of the check-point times of the restart option has been encountered. Input to the subroutine is made through the included common block regions and the subroutine call argument list.

CALLING STATEMENT ARGUMENT LIST			
Mnemonic	Symbol Ref. (1)	Type

Figure 3-4. Example ECHO Output

3.1.2.13 RSIN

In subroutine RSIN state vector data are retrieved through calls to subroutine DATIN. RSIN is called only when a restart run is made. Input of data to the subroutine is made through the calling statement argument list while output is through the included common block region.

CALLING STATEMENT ARGUMENT LIST			
Mnemonic	Symbol Ref. (1)	Type	
IMODEL	Name	R*8	Restart run name identifier
ICASE	Case No.	I*4	Restart run name identifier
IMSEC		I*4	Restart time in milliseconds

3.1.2.14 DOAIJ

Beam fundamental uncoupled frequencies, beam constants, and beam Euler angle transformations are computed in subroutine DOAIJ. The frequencies are computed using equations 1-55a and 1-55b of Reference (1) while the damping constants are determined using equation 1-54 of Reference (1). All input and output to the subroutine is accomplished through the various common block regions included in the subroutine.

3.1.2.15 RC

Within subroutine RC the initial conditions for all model elements are computed for a restart run. In addition, allowable force and deflection are determined and printed. Subroutine RC is called only when a restart case is run. Input and output to the subroutine is accomplished through the various common block regions included in the subroutine.

3.1.2.16 PRINT

Subroutine PRINT is called at the beginning of each run and at each print-time interval specified in the input data. The subroutine provides for the printing of dynamic response information defining the motion of massless nodes and masses, the forces and deflections associated with all beam and spring elements, and a complete energy distribution summary for the model. Examples of the data printed are shown in Figure 3-5.

When summary plots are requested, the necessary mass and element data are processed and written on the temporary data storage units specified in Section 2.2. Storage of this data takes place at each print-time interval.

Position plots are also generated within the PRINT subroutine by a call to subroutine PAPLOT. This call is made at the plot time interval specified in the input data.

All input and output to subroutine PRINT is accomplished through the various common block regions included in the subroutine.

3.1.2.17 IC

Within subroutine IC the initial condition data for all elements of the model are determined. Subroutine IC is called at the beginning of each run except a restart run, in which case subroutine RC is called. In addition to the initial condition data, subroutine IC determines allowable beam force and deflection data. These data are based on the theoretical discussion presented in Section 1.3.17 of Reference (1).

An example of the data printed from subroutine IC is shown in Figure 3-6. Input and output to this subroutine is accomplished through the various common block regions included in the subroutine.

THIS PAGE IS BEST QUALITY AVAILABLE
FROM COPY FURNISHED TO DDO

3.1.2.18 MATMUL

Subroutine MATMUL carries out the matrix multiplication $A*B$ and returns the results in C.

CALLING STATEMENT ARGUMENT LIST			
Mnemonic	Symbol Ref. (1)	Type	
A		R*8	Input matrix
B		R*8	Input matrix
C		R*8	Resulting Output matrix

3.1.2.19 PREPLT

Subroutine PREPLT is called at the end of each run. The subroutine retrieves and reorders data sets previously stored on the logical units specified in Section 2.2. After processing, the data are transferred to subroutine PLOTT for subsequent output as summary plots. When the processing of data cannot be accomplished within the working space allocated to the subroutine, logical unit 12 is used for the temporary storage of the processed data. The maximum number of elements that can be accommodated in the allocated working space is tabulated in Table 3-2. Input of data to the subroutine is through the calling statement argument list as well as through the included common block regions.

CALLING STATEMENT ARGUMENT LIST			
Mnemonic	Symbol Ref. (1)	Type	
DELTAT		R*8	Integration time interval
NM		I*4	Number of mass elements
NNP		I*4	Number of massless node elements
NB		I*4	Number of beam elements
NSP		I*4	Number of external springs
NDRI		I*4	Number of DRI elements
MSECIN		I*4	Check point save times

TABLE 3-2. PLOT ELEMENT WORKING SPACE LIMITS

Element	Maximum Number of Elements Accommodated in Working Space
MASS	31
MASSLESS NODE	41
BEAM (Forces)	51
BEAM (Deflections)	51
BEAM (Stresses)	51
EXTERNAL SPRINGS	41
BEAM (Energies)	51
DRI	101

3.1.2.20 PLOTT

Subroutine PLOTT is called by subroutine PREPLOT and provides printer plotting capability for summary time history plots of requested model elements. This subroutine is a modified version of one published by Dr. David H. Laananen, Reference (4). The subroutine accepts data through the calling statement argument list and outputs the data in a special plot format. An example of the plot format is shown in Figure 3-7.

CALLING STATEMENT ARGUMENT LIST			
Mnemonic	Symbol Ref. (1)	Type	
M		I*4	Number dependent variables
NP		I*4	Dimension of X, Y1, Y2, Y3 arrays
X		R*4	Values for the independent variable
Y1		R*4	} Values for the dependent variables
Y2		R*4	
Y3		R*4	

Figure 3-7. Example PLOTT Output

3.1.2.21 PAPLOT

Subroutine PAPLOT is called by subroutine PRINT at the beginning of each run and at each position plot time. See Section 2.2.7, Reference (2). The subroutine provides program KRASH with on-line plotting capability for plotting the location of mass elements in two-dimensional space. An example plot is shown in Figure 3-8.

Calls are made from PAPLOT to subroutines FSHELL, SHELLX, and SHELLM where data to be plotted is sorted. Based on the returned sorted data, format statements are generated which produce the desired position plots. Input data is supplied to PAPLOT through the calling statement argument list and the included common block regions.

CALLING STATEMENT ARGUMENT LIST			
Mnemonic	Symbol Ref. (1)	Type	
V		R*8	Quantity to be plotted along horizontal axis
W		R*8	Quantity to be plotted along vertical axis
XSCALE		R*4	Horizontal axis scale factor
YSCALE		R*4	Vertical axis scale factor
NPTS		I*2	Number of point to be included in plot
ISCALE		I*2	Scale option control flag

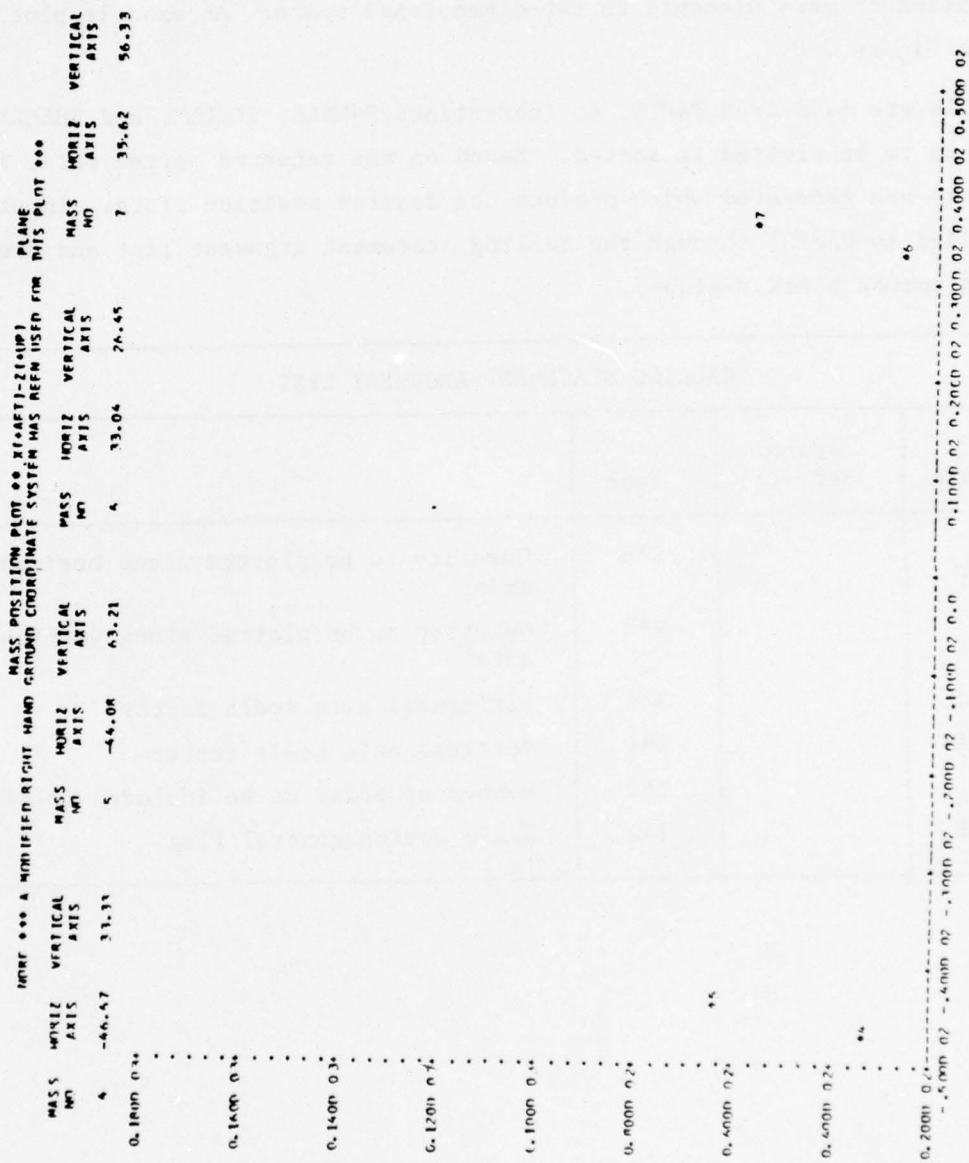

Figure 3-8. Example PAPLOT Output

3.1.2.22 FSHELL

Subroutine FSHELL is called by subroutine PAPLOT. In this subroutine elements located in ARRAY are sorted and relocated in ARRAY in ascending order (algebraically least first). The array KEY identifies and returns the original location of the corresponding element in ARRAY.

All data are passed through the calling statement argument list.

CALLING STATEMENT ARGUMENT LIST			
Mnemonic	Symbol Ref. (1)	Type	
ARRAY		R*4	Array containing elements to be sorted
KEY		I*4	Array containing integer flags which identify the location of corresponding ARRAY elements prior to sorting
N		I*4	Number of elements in ARRAY

3.1.2.23 SHELLX

Subroutine SHELLX is called by subroutine PAPLOT. In this subroutine elements of the array DARRAY are reordered in accordance with the locations specified by the elements in KEY.

All data are passed through the calling statement argument list.

CALLING STATEMENT ARGUMENT LIST			
Mnemonic	Symbol Ref. (1)	Type	
DARRAY		R*4	Array containing elements to be sorted
KEY		I*4	Array containing integer flags which identify order in which elements of DARRAY are to be sorted.
N		I*4	Number of elements in DARRAY

3.1.2.24 SHELLM

Subroutine SHELLM is called by subroutine PAPLOT. In this subroutine elements of the array M are reordered in accordance with the locations specified by the elements in KEY.

All data are passed through the calling statement argument list.

CALLING STATEMENT ARGUMENT LIST			
Mnemonic	Symbol Ref. (1)	Type	
KEY		I*4	Array containing integer flags which identify order in which elements of M are to be sorted.
M		I*4	Array containing elements to be sorted
N		I*4	Number of elements in M

3.2 COMMON BLOCK REGIONS

3.2.1 Common Block/Subroutine Cross Reference

Program KRASH is designed so that data storage and transfer is accomplished using the many common block regions defined within the program. A cross reference of the common block names and using subroutines is given in Table 3-3. Included in the cross reference summary are the core sizes required by the IBM 360 computer system for each of the regions.

3.2.2 Symbol Definitions

All of the common block regions allocated in program KRASH are summarized in Table 3-4. Included in the summary are the symbols used to identify the variables which make-up each block along with the symbol type, array dimension, and a brief definition.

3.1.2.22 FSHELL

Subroutine FSHELL is called by subroutine PAPLOT. In this subroutine elements located in ARRAY are sorted and relocated in ARRAY in ascending order (algebraically least first). The array KEY identifies and returns the original location of the corresponding element in ARRAY.

All data are passed through the calling statement argument list.

CALLING STATEMENT ARGUMENT LIST			
Mnemonic	Symbol Ref. (1)	Type	
ARRAY		R*4	Array containing elements to be sorted
KEY		I*4	Array containing integer flags which identify the location of corresponding ARRAY elements prior to sorting
N		I*4	Number of elements in ARRAY

3.1.2.23 SHELLX

Subroutine SHELLX is called by subroutine PAPLOT. In this subroutine elements of the array DARRAY are reordered in accordance with the locations specified by the elements in KEY.

All data are passed through the calling statement argument list.

CALLING STATEMENT ARGUMENT LIST			
Mnemonic	Symbol Ref. (1)	Type	
DARRAY		R*4	Array containing elements to be sorted
KEY		I*4	Array containing integer flags which identify order in which elements of DARRAY are to be sorted.
N		I*4	Number of elements in DARRAY

TABLE 3-4. COMMON BLOCK SUMMARY (Continued)

Common Name	Mnemonic	Type	Array Size		
BLANKCOM (Cont'd)	WOLD	R*8	80	Previous Value for	W
	XOLD	R*8	80		X
	YOLD	R*8	80		Y
	ZOLD	R*8	80		Z
	PINO	R*8	80		PIN
	QINO	R*8	80		QIN
	RINO	R*8	80		RIN
	PHIOLD	R*8	80	Previous Value for	PHI
	THEOLD	R*8	80		THETA
	PSIOLD	R*8	80		PSI
	XACFD	R*8	80	Time Derivative of	XACF
	YACFD	R*8	80		YACF
	ZACFD	R*8	80		ZACF
	XAFOLD	R*8	80	Previous Value for	XACF
	YAFOLD	R*8	80		YACF
	ZAFOLD	R*8	80		ZACF
	XNPFD	R*8	50	Time Derivative of	XNPF
	YNPFD	R*8	50		YNPF
	ZNPFD	R*8	50		ZNPF
	XANPFO	R*8	50	Previous Value for	XACNPF
	YANPFO	R*8	50		YACNPF
	ZANPFO	R*8	50		ZACNPF
	TKR	R*8	200	Times for beam yielding and rupture summary table.	
	TPEN	R*8	80	Penetration times.	
	DTHALF	R*8		Half of time interval.	

TABLE 3-4. COMMON BLOCK SUMMARY (Continued)

Common Name	Mnemonic	Type	Array Size	
BLANKCOM (Cont'd)	KRBEAM	I*4	4,200	1. Beam number for yield + rupture summary table. 2. Direction of yielding. 3. Direction of rupture. 4. Tension or compression code.
	KRFLAG	I*4	6,150	Set to 1.0 when i^{th} beam ($i = 1 \rightarrow 150$) yield in ℓ^{th} direction ($\ell = 1 \rightarrow 6$)
	IPEN	I*4	80	Mass which penetrates control volume.
	KPEN	I*4		Number of mass penetrations.
	KRCONT	I*4		Total number of lines of print in yielding and rupturing table.
CFIC	SINBET	R*8		Sin (Beta)
	COSBET	R*8		Cos (Beta)
	ABETA	R*8	9	Rotational transformation - ground to slope axis.
CFIR	SIFL	R*8	40	$\left. \begin{array}{l} \text{External spring} \\ \text{deflection} \\ \text{values at} \end{array} \right\} \left. \begin{array}{l} \text{Initial end of first load level} \\ \text{start of second load level} \\ \text{final} \end{array} \right\}$
	SAFL	R*8	40	
	SBFL	R*8	40	
	SFFL	R*8	40	
	XKEFL	R*8	40	bottoming spring stiffness.
CFPR	FSPRNG	R*8	40, 7	External spring output print quantities.
	DELG	R*8	40	Ground deflection.
COMALL	C	R*8	6,150	Damping coefficients
	P	R*8	80	$\left. \begin{array}{l} \text{Angular} \\ \text{Velocity} \\ \text{about} \end{array} \right\} \left. \begin{array}{l} X \\ Y \\ Z \end{array} \right\} \text{Axes}$
	Q	R*8	80	
	R	R*8	80	

TABLE 3-4. COMMON BLOCK SUMMARY (Continued)

Common Name	Mnemonic	Type	Array Size	
COMALL (Cont'd)	U	R*8	80	Damping coefficients
	V	R*8	80	
	W	R*8	80	
	X	R*8	81	Linear Velocity along $\begin{Bmatrix} X \\ Y \\ Z \end{Bmatrix}$ Axes
	Y	R*8	81	
	Z	R*8	81	
	AI	R*8	9	Ground Coordinate of mass
	AJ	R*8	9	Rotational transformation for mass I body axis to ground axis.
	SC	R*8	40	Rotational transformation for mass J body axis to ground axis.
	XC	R*8	6	Spring axial deflection.
	XK	R*8	5400	Six spring forces for mass I.
	XI	R*8	80	Stiffness matrix for all beams.
	YI	R*8	80	
	ZI	R*8	80	
	XYI	R*8	80	
	XZI	R*8	80	
	YZI	R*8	80	
	AIJ	R*8	9	
	BIJ	R*8	720	Mass moment of inertia $\begin{Bmatrix} I_{XX} \\ I_{YY} \\ I_{ZZ} \\ I_{XY} \\ I_{XZ} \\ I_{YZ} \end{Bmatrix}$
	DRI	R*8	150	Rotation transformation, beam axis into ground axis.
	OAI	R*8	720	All elements of Ai matrix.
				Dynamic Response Index for beam.
				OLD AI matrix.

TABLE 3-4. COMMON BLOCK SUMMARY (Continued)

Common Name	Mnemonic	Type	Array Size	
COMALL (Cont'd)	VEE	R*8	900	Beam relative deflection vector.
	WGT	R*8	80	Mass weight.
	PHI	R*8	80	} Euler angles defining orientation of mass I relative to ground.
	THETA	R*8	80	
	PSI	R*8	80	
	PDOT	R*8	80	
	QDOT	R*8	80	} Time derivative of
	RDOT	R*8	80	
	UDOT	R*8	80	
	VDOT	R*8	80	
	WDOT	R*8	80	
	XDOT	R*8	80	
	YDOT	R*8	80	
	ZDOT	R*8	80	
	PHIDOT	R*8	80	
	THEDOT	R*8	80	
	PSIDOT	R*8	80	
	TIME	R*8		Time.
	DFLTAT	R*8		Integration time interval.
	XACC	R*8	80	} Acceleration in body axis.
	YACC	R*8	80	
	ZACC	R*8	80	
	AIDOT	R*8	9	} Euler angles defining beam axis relative to ground. Used to calculate AIJ.
	PHIIJ	R*8	150	
	THEIJ	R*8	150	
	PSIIJ	R*8	150	
	SUMDF	R*8	6,150	Summation of incremental strain forces over time.

TABLE 3-4. COMMON BLOCK SUMMARY (Continued)

Common Name	Mnemonic	Type	Array Size	
COMALL (Cont'd)	TITLE	I*4	40	Run title.
	XLBAR	R*8	40	External spring length.
	FSPBAR	R*8	40	External spring axial load when unloading occurred.
	VEEDOT	R*8	3, 3	Spring contact point velocities relative to ground.
	DX	R*8	81	} change, over { X time Δt of { Y Z
	DY	R*8	81	
	DZ	R*8	81	
	DPIN	R*8	81	} change { $\int p dt$ } incremental in { $\int q dt$ } rotation { $\int r dt$
	DQIN	R*8	81	
	DRIN	R*8	81	
	SEIJ	R*8	150	Strain energy for beam IJ.
	DEIJ	R*8	150	Damping energy for beam IJ.
	CEIK	R*8	40	Crushing energy } for ex- Friction energy } ternal Unloading deflection } spring Unloading stiffness } IK
	CEIKF	R*8	40	
	SBAR	R*8	40	
	KUN	R*8	40	
	MAXNM	I*4		Maximum number of masses.
	MAXIGS	I*4		Maximum number of beams.
	MAXTBL	I*4		Maximum number of KR tables.
	NM	I*4		Number of mass elements.
	NB	I*4		Number of beam elements.
	I	I*4		Mass number.
	J	I*4		Mass number.
	IG	I*2	150	Mass at i th } end of beam Mass at j th } IJ
	JG	I*2	150	
	N1	I*2	900	Unloading - reloading { beam Flag for { spring
	NN	I*2	40	
	IJPR	I*2	150	

TABLE 3-4. COMMON BLOCK SUMMARY (Continued)

Common Name	Mnemonic	Type	Array Size	
COMMI2	IQ	I*2	180	Mass number I for KR table.
	JQ	I*2	180	Mass number J of KR table.
	LQ	I*2	180	Direction identification for KR table.
	NPQ	I*2	180	No. of points in KR table.
	INBUF	I*2	80	Mass numbers for nonstandard HE's.
	NKMVEC	I*2	150	Beams with directly input K matrices.
	ISAVE	I*2	180	Beams with KR tables.
COMMI4	ND	I*4		No. of nonstandard damping values for beams.
	NVBMN	I*4		No. of beams having nonstandard maximum negative deflection cut-off.
	NFBMN	I*4		No. of beams having nonstandard maximum negative load cut-off.
	NHI	I*4		No of nonstandard He's or non zero I _{XY} , I _{YZ} , I _{ZX} .
	NKM	I*4		No. of user supplied stiffness matrices.
	NLB	I*4		No or nonlinear beam KR curves.
	NPH	I*4		No. of masses having nonstandard Euler angles.
	NMTL	I*4		No. of nonstandard materials.
	NPTS	I*4	50	No. of points in accel. history table.
	NVBM	I*4		No. of beams having nonstandard maximum positive deflection cut-off.
	IJPRT	I*4	14	DRI element identification numbers.
	IPHDP	I*4	80	Mass number for nonzero Euler angles.
	NFBM	I*4		No. of beams having nonstandard maximum positive load cut-off.
COMMR4	KR	R*4	2700	Stiffness reduction factor.
	LDP	R*4	180	Linear deflection point.
	LDP1	R*4	180	Linear deflection point for reloading.
COMMR8	G	R*8	150	Beam material shear modulus.
COMNEW	DAMPC	R*8		Default critical damping coefficient for all beams.
	RUNMOD	R*8		Run mode control flag.
	PUNMOD	R*8		Punch mode control flag.

TABLE 3-4. COMMON BLOCK SUMMARY (Continued)

Common Name	Mnemonic	Type	Array Size	
DEIC	WTOT	R*8		Total vehicle weight.
	CLTEST	R*4	150	Beam elements which lie in the airplane plane of symmetry.
DEIN	XNBAR	R*8		Coordinates defining volume for MASS penetration calculations.
	XPBAR	R*8		
	YNBAR	R*8		
	YPBAR	R*8		
	ZNBAR	R*8		
	ZPBAR	R*8		
	VOLENZ	R*8	5, 3	Volume change reference volumes time zero lengths.
	HEX	R*8	80	Angular momenta of rotating masses.
	HEY	R*8	80	
	HEZ	R*8	80	
	ALIFT	R*8	80	Aerodynamic lift constant for mass I.
	VMAX	R*8	900	Maximum allowable beam positive deflections - rupture.
	VMAXN	R*8	900	Maximum allowable beam negative deflections - rupture.
	FMAXN	R*8	900	Maximum allowable beam negative force - rupture.
	XKS	R*4	2700	Slopes } for KR table calculations.
	XKI	R*4	2700	
	XKR	R*4	2700	
	NLSFLG	I*2	900	Nonlinear beam table member.
	CHUG	I*2	180	Starting point in KR table for beam IJ.
	MVP	I*4		Mass volume penetration identification.
	FMAX	R*8	900	Maximum allowable beam positive force - rupture.

TABLE 3-4. COMMON BLOCK SUMMARY (Continued)

Common Name	Mnemonic	Type	Array Size	
DEINPR	AA	R*8	150	Beam cross sectional area.
	E	R*8	150	Beam material elastic mod.
	YY	R*8	150	Area moment of inertia I_y .
	ZZ	R*8	150	Area moment of inertia I_z .
	XIQ	R*8	150	Torsional stress parameter.
	XLB	R*8	150	Beam length.
	Z1	R*8	150	Distance to extreme fiber.
	Z2	R*8	150	Distance to extreme fiber.
	MC	I*4	150	Material code.
	XJ	R*8	150	Beam polar area moment of inertia.
	SF26	R*8	150	Shape factor for moment about Z axis at beam i^{th} end.
	SF35	R*8	150	Shape factor for moment about Y axis at beam i^{th} end.
	SF26J	R*8	150	Shape factor for moment about Z axis at beam j^{th} end.
	SF35J	R*8	150	Shape factor for moment about Y axis at beam j^{th} end.
	PY	I*4	150	} Designates beam pinned at i^{th} end.
	PZ	I*4	150	
	PYJ	I*4	150	} Designates beam pinned at j^{th} end.
	PZJ	I*4	150	
	NSC	I*4		Flag to call for stress calculation.
	NPIN	I*4	150	No. of pin-ended beams.
DEIR	PLM26	R*8	150	Plastic moment about Z axis at beam i^{th} end.
	PLM35	R*8	150	Plastic moment about Y axis at beam i^{th} end.
	PLM26J	R*8	150	Plastic moment about Z axis at beam j^{th} end.
	PLM35J	R*8	150	Plastic moment about Y axis at beam j^{th} end.
DEMA	DEVMAX	R*8		Maximum percent deviation for mass energy calculations.

TABLE 3-4. COMMON BLOCK SUMMARY (Continued)

Common Name	Mnemonic	Type	Array Size	
DEPR	XDOTAP	R*8		} Overall vehicle velocity parallel to ground axis. { X Y Z
	YDOTAP	R*8		
	ZDOTAP	R*8		
	DLVOC	R*8	5, 3	Volume length changes.
	FRD	R*8	150,4	Ratio of current max. stress to failure stress - constant energy at dist. theory.
	FRS	R*8	150,4	Ratio of current max. stress to failure stress - max. shear theory.
	SUMDFI	R*8	6,150	Strain force at i^{th} mass.
	FINTI	R*8	6,150	Total of strain and damping force at i^{th} mass.
	VEEN	R*8	2,150	Sum of θ and ψ deflections at i^{th} and j^{th} ends of the beam.
DINICP	STENS	R*8	20	Tension yield stress.
	SCOMP	R*8	20	Compression yield stress.
	SHEAR	R*8	20	Shear yield stress.
	EE	R*8	20	Young's modulus.
	GG	R*8	20	Torsional modulus.
	FINT	R*8	6,150	Total beam force.
	VOL	R*8	5	} volume for volume change Initial } calculations
	VZERO	R*8	5	
	KMATR	I*4	6, 4	Volume corner numbers.
	NVCH	I*4		Number of volumes.
DOIN ENERGY	INBUFF	I*2	5, 8	Mass numbers forming volumes.
	CBAR	R*8	150	Damping coefficient for beam IJ.
	XPCT	R*8	80	Percent of total energy change at mass.
	XETOT	R*8	80	Total energy (by masses and for system).
	XETOTO	R*8	80	Initial total energy (by masses and for system).
	XSE	R*8	80	Mass related strain energy.
	XDE	R*8	80	Mass related damping energy.
	XCE	R*8	80	Mass related crushing energy.
	XFE	R*8	80	Mass related friction energy.
	KEI	R*8	80	Mass related kinetic energy.

TABLE 3-4. COMMON BLOCK SUMMARY (Continued)

Common Name	Mnemonic	Type	Array Size	
ENERGY (Cont'd)	PEI	R*8	80	Mass related potential energy.
	XETOTL	R*8		Total system energy.
	KETOTL	R*8		Total system kinetic energy.
	PETOTL	R*8		Total system potential energy.
	SETOTL	R*8		Total system strain energy.
	DETOTL	R*8		Total system damping energy.
	CETOTL	R*8		Total system crushing energy.
	FETOTL	R*8		Total system friction energy-
IBALL	IBUFI	I*4	20	Index for new materials.
INAC	ACCEL	R*8	300	Table of option mass acceleration levels.
	TIM	R*8	300	Time at which acceleration levels are input.
	INDEX	I*4	50, 2	Mass number and direction index for acceleration data.
	JAY	I*4	50, 2	Table number and number of acceleration points in table.
INCF	KOUNT	I*4		Counter for number of acceleration pulse points.
	SA	R*8	40	} External spring input table parameters.
	SB	R*8	40	
	SF	R*8	40	
	SI	R*8	40	
	XMU	R*8	40	External spring coeff. of friction.
	XKE	R*8	40	Bottoming spring stiffeners.
	XMAX	R*8	40	} External spring {
	FSPOF	R*8	40	
	FSPOI	R*8	40	
	GFLEX	R*8	40	Ground stiffness
	CDAMP	R*8	40	External spring damping coefficient
	PLOWT	R*8		Starting time for plowing force.
INCFIC	BETA	R*8		Ground slope angle - degrees.
INDEAC	NACC	I*4		Number of acceleration input tables.
INIC	XDP	R*8	80	} coordinates of mass points
	ZDP	R*8	80	

TABLE 3-4. COMMON BLOCK SUMMARY (Continued)

Common Name	Mnemonic	Type	Array Size		
INIC (Cont'd)	PHIDP	R*8	80	} Euler angles for body axis to airplane axis at t = 0.0.	
	PSIDP	R*8	80		
	THEDP	R*8	80		
	PPR	R*8		} Initial airplane angular velocities.	
	QPR	R*8			
	RPR	R*8			
	XGIN	R*8		Distance aft } of initial c.g. position	
	ZGIN	R*8			Distance up } of vehicle
	PHIPR	R*8		} Initial airplane attitude relative to ground.	
	PSIPR	R*8			
	THEPR	R*8			
	XGDOT	R*8		} Initial airplane c.g. velocity in ground axis.	
	YGDOT	R*8			
	ZGDOT	R*8			
INIDCP	YDP	R*8	80	Mass "Y" coordinate.	
ININPR	NSF	I*4		} Print flags for {	beam strain forces
	NTF	I*4			total beam forces
	NDE	I*4			beam deflections
	NSPD	I*4			spring loads and deflections
	NED	I*4			energy breakdown by mass
	NS	I*4			beam & spring
	NRP	I*4			beam stresses
	NIMP	I*4			mass displacements, velocities, and accelerations
INOUT	FCUT	R*8			mass impulses
	NTOL1	I*2			Cutoff frequency for digital filter.
	NTOL2	I*2			Tolerances for total energy growth.
	NTOL3	I*2			Tolerance for negative train, damping, crushing and friction length.
INPR	NDRI	I84			Tolerance for mass energy deviation.
	NSP	I*4			Number of DRI beam elements.
					Number of external springs.

TABLE 3-4. COMMON BLOCK SUMMARY (Continued)

Common Name	Mnemonic	Type	Array Size	
IPIC	NIC	I*4		Flag to call for print out of preliminary failure loads and deflections.
IRDE	PFIL	R*8		Tire constant.
MACF	FSOP	R*8	40	Maximum spring force - previous value.
	SCP	R*8	40	Maximum spring deflection - previous value.
	EXSP	R*8	5,200	<ul style="list-style-type: none"> 1. Initial deflection value. 2. Maximum force value. 3. Maximum deflection value. 4. Unloaded deflection value. 5. Unloaded force value.
	TSP	R*8	200	Time for external spring loading or unloading event.
	STEMP1	R*8	40	Temporary tracking of external spring deflections and forces for use in restart.
	STEMP2	R*8	40	
	STEMP3	R*8	40	
	STEMP4	R*8	40	
	STEMP5	R*8	40	
	KKSP	I*4	5,200	<ul style="list-style-type: none"> 1. Spring mass number. 2. Massless node number. 3. Spring direction. 4. Type = JBS. 5. Not used.
	KKONT	I*4		Total number of lines of print for external spring behavior summary.
	IBS	I*2	40	Flag cut to 1 when external spring has bottomed.
	JBS	I*2	40	Flag used in summary of external spring behavior: <ul style="list-style-type: none"> 1. Initial loading. 2. Max. loading. 3. Unload to zero. 4. Start of reload.
MACFIN	IPRINT	I*4		Multiple of time increment defining print time.
	TMAX	R*8		Maximum run time.
MADE	KFL26	I*4	150	Flag that indicates whether direction 2 or 6 went nonlinear first.
	KFL35	I*4	150	Flag that indicates whether direction 3 or 5 went nonlinear first.

TABLE 3-4. COMMON BLOCK SUMMARY (Continued)

Common Name	Mnemonic	Type	Array Size			
MADE (Cont'd)	FL26I	I*2	150	{ Flag to indicate occurrence of plastic hinge formation about Z axis at i th & j th end and about Y axis at i th and j th end, respectively.		
	FL26J	I*2	150			
	FL35I	I*2	150			
	FL35J	I*2	150			
	BPL	I*4	100,3	Plastic hinge summary beam number, direction, and i th or j th end.		
	KPL	I*4	—	Counter for number of plastic hinge formations.		
	TPL	R*8	100	Time of plastic hinge formation.		
MAPR	ETOTTO	R*8		Total system energy for time zero.		
	ENGSMY	R*4	6,200	Energy summary terms printed at end of run.		
	INGSCT	I*4		Total number of time cuts printed in energy summary.

3.3 PERMANENT DATA STORAGE AND RETRIEVAL

The tape data management routines included in program KRASH are executed when the restart option is invoked. The routines provide a systematic means by which data can be stored on and retrieved from magnetic tape. A general description of the management system and routines involved is provided in the following sections.

3.3.1 Tape Data Management

3.3.1.1 Data Storage

Before any data can be stored, it is necessary to first place an end of file (EOF) mark at the beginning of the reserved tape allocated for the permanent storage of restart data. This is necessary because when data are stored the routines search for an EOF mark before storing.

Data are stored in blocks which are referred to as "user data sets". These data sets are made up of the state vector data referred to in Section 2.3. Prior to storing a user data set, a header is generated and placed at the beginning of the user data set along with restart information supplied as input which uniquely identifies the data set. See Section 2.1 of Reference (2) and line 6 of the Example Input Data, Figure 4-2 of this manual.

3.3.1.2 Data Retrieval

A user data set previously stored as part of the restart option may be retrieved by searching the stored data for the header information which identifies the desired data set. The header information identifying the desired data set is supplied as input data. See Section 2.1 of Reference (2) and line 5 of the Example Input Data, Figure 4-3 of this manual.

3.3.2 Data Management Routines

3.3.2.1 Data Storage

3.3.2.1.1 OPNOUT

OPNOUT is an entry point in subroutine DATOUT. The call to OPNOUT is made from subroutine RSOUT to open a new data set.

OPNOUT reads through the data on the restart tape until an EOF mark is located. The tape is backspaced over the EOF mark and the user data set mark (**START*) and header is written over the EOF mark. The header consists of a 24-word (96 byte) record containing the following information:

- Words 1-2 Date in the form MM-DD-YY supplied by a call to subroutine CDATE
- Words 3-24 Data supplied by a call to subroutine JOBAC

CALLING STATEMENT ARGUMENT LIST			
Mnemonic	Symbol Ref. (1)	Type	
UNIT		I*4	Unit allocated for the reversed restart tape (Unit 21)

3.3.2.1.2 DATOUT

Subroutine DATOUT is called by subroutine RSOUT. Data are collected within DATEOUT. To these data are added an 8-character literal used to name the data set and a four byte word which specifies the number of words to be stored. Thus, the total data set consists of (1) an 8-character literal, (2) a 4 byte word, and (3) the state vector data. All data are stored in blocks of 250 words in core. When the block is filled, the data are written onto the reserved restart tape.

CALLING STATEMENT ARGUMENT LIST			
Mnemonic	Symbol Ref. (1)	Type	
X		I*4	State vector data to be saved
NAME	NAME	R*8	Check point run name identifier
NWDS		I*4	Number of words to be stored
UNIT		I*4	Unit allocated for the reserved restart tape (Unit 21)
ERROR		I*4	Error flag returned by the tape write routine

3.3.2.1.3 CLSOUT

CLSOUT is an entry point in subroutine DATOUT. The call to CLSOUT is made from subroutine RSOUT to close a new data set.

CLSOUT fills any remaining space in the 250-word block used by DATOUT with end of data set marks (*END). After the block is filled and written onto the reserved restart tape an EOF mark is placed on the tape. The tape is then backspaced over the EOF mark in anticipation of a further extension of the tape.

CALLING STATEMENT ARGUMENT LIST			
Mnemonic	Symbol Ref. (1)	Type	
UNIT		I*4	Unit allocated for the reserved restart tape (Unit 21)

3.3.2.1.4 JOBAC

Subroutine JOBAC is supplied as a dummy subroutine. It provides a means by which user supplied accounting or other pertinent information can be returned to the calling subroutine DATOUT as a 22-word array named ACCARD. As supplied, JOBAC returns blank data.

CALLING STATEMENT ARGUMENT LIST			
Mnemonic	Symbol Ref. (1)	Type	
ACCARD		R*4	Twenty-two word blank array

3.3.2.1.5 CDATE

Subroutine CDATE is supplied as a dummy subroutine. It provides a means by which the current date, to be supplied by the user, can be returned to the calling subroutine DATOUT by way of the calling statement agreement list. As supplied, this subroutine returns the character strings MM-D and D-YY.

CALLING STATEMENT ARGUMENT LIST			
Mnemonic	Symbol Ref. (1)	Type	
DATE		R*4	Dummy array name
ITYPE		I*4	Dummy name

3.3.2.2 Data Retrieval

3.3.2.2.1 OPNIN

OPNIN is an entry point in subroutine DATIN. The call to OPNIN is made from subroutine RSIN to open an existing user data set prior to the retrieval of data.

OPNIN reads the reserved restart tape until a user data set mark (**START*) is found. The first 250 word block after the user data set mark is read and the header and data set identifiers are recovered and returned to RSIN.

CALLING STATEMENT ARGUMENT LIST			
Mnemonic	Symbol Ref. (1)	Type	
HEADER		I*4	Header array
NWDS		I*4	Number of words to be retrieved
UNIT		I*4	Unit allocated for the reserved restart tape (Unit 21)
ERROR		I*4	Error flag returned by tape read routine

3.3.2.2.2 DATIN

Subroutine DATIN is called from subroutine RSIN. DATIN receives header and user data set identifiers from OPNIN. The identifiers are compared with corresponding identifiers supplied as input data. See Section 2.1 of Reference (2). If agreement is achieved, the remaining data in the user data set are read from the reserved restart tape and returned to RSIN. If the comparison fails, execution is passed to CLSIN where the data set is closed and OPNIN called again.

CALLING STATEMENT ARGUMENT LIST			
Mnemonic	Symbol Ref. (1)	Type	
X		R*8	State vector quantity retrieved
NAME		R*8	Restart run name identifier
NWDS		I*4	Number of words to be returned
UNIT		I*4	Unit allocated for the reserved restart tape (Unit 21)
ERROR		I*4	Error flag returned by tape read routine

3.3.2.2.3 CLSIN

CLSIN is an entry point in subroutine DATIN. The call to CLSIN is made from subroutine RSIN to close a currently opened user data set by scanning the data set until an end of data mark (*END) is found.

CALLING STATEMENT ARGUMENT LIST			
Mnemonic	Symbol Ref. (1)	Type	
UNIT		I*4	Unit allocated for reserved restart tape
ERROR		I*4	Error flag returned by tape read routine

3.4 ERROR/WARNING MESSAGES

Tests of pertinent data are made at strategic locations throughout program KRASH. These checks are designed to identify erroneous input data and inconsistent system operations and computational results. A summary of the error messages resulting from the failure of any of these tests is presented in Table 3-5. Referenced in the table is the subroutine and format statement generating the message.

TABLE 3-5. ERROR/WARNING MESSAGE SUMMARY

Message No.	Error/Warning Message	Format Label	Sub-Routine
1	IDER OUT OF RANGE, VALUE = _____ Degree of freedom flag assigned to tabulated input acceleration data not within the allowable range of 1 through 6. Control returned to calling routine.	6106	ACCELT
2*	NO SUCH NODE POINT I, M = _____ External spring attached to node which has not previously been defined. Run terminated.	9	CFORCE

SECTION 4

DEMONSTRATION PROBLEM

The example problem included in this section has been designed to meet two objectives. The first is to illustrate an input data card deck which exercises some commonly used options available to the user of the program. The second is to provide output data to be used as an operational and numerical check of the program. The model used in the example does not represent any particular vehicle nor any particular crash condition.

4.1 MODEL DESCRIPTION

The left side of the model developed for this example is shown in Figure 4-1. The composite model consists of 20 external springs (NSP), 4 nonlinear beams (NLB), 12 massless node points (NNP), 10 pin-ended beams (NPIN), 8 unsymmetrical beams (NUB), 2 DRI's (DRI), 2 beam damping inputs (ND) and a RUNMOD = 2, which is a half model input and subsequent full vehicle analysis. The impact is with a flat surface at a vertical sink velocity of 27.5 ft/sec and a 0.75-degree nose-up pitch angle. The computer run is performed with a 1×10^{-5} integration interval and a maximum time of 2×10^{-5} seconds. The RUNMOD = 2 is chosen to demonstrate how centerline and opposite side members are automatically selected by program KRASH. The impact condition is symmetrical, so for this type of analysis the user will normally use the RUNMOD = 1 option, which is more economical to perform.

4.2 INPUT DATA DECK

The input data deck used in the demonstration run is shown in Figure 4-2. The card identification numbers (columns 73-80) used in this deck does not follow the numbering convention used in the program KRASH User's Manual, Figure 2-1 of Reference (2). Use of the system shown in the User's Manual is not mandatory. Note that the last card of the input deck contains the work "END" beginning in column one.

(b) Restart data

Figure 4-3 Example Input Data-Checkpoint and Restart Runs

For illustrative purposes, Figure 4-3 shows a portion of the ECHO decks for a checkpoint run which generates data for a future restart run and a restart run which initiates at the previously designated save time. Output from these latter two data cases are not included in Appendix A.

4.3 OUTPUT

A complete listing of the output for the demonstration run is included in this report as Appendix A. The format of the data is discussed in detail in Section 2.2 of the User's Manual.

MODEL PARAMETERS

VEHICLE WT = 5.455026D 02

VEHICLE CG POSITION

X (FS) = 1.6236D 02

Y (BL) = -7.22426D-16

Z (WL) = 7.52637D-01

VEHICLE INERTIAS (IN-LB-SEC**2)

I(XX) = 7.60483D 02

I(YY) = 5.33511D 02

I(ZZ) = 4.60357D 02

VEHICLE CG INITIAL GROUND COORDINATES

XCG IS THE DISTANCE FROM SLOPE/GROUND INTERSECTION TO VEHICLE CG, *FORWARD

ZCG IS THE DISTANCE FROM GROUND PLANE TO VEHICLE CG, *DOWN

XCG = 0.0

ZCG = -2.49957D 01

SUMMARY OF EXTERNAL SPRING LOADING AND UNLOADING

TYPE:1=INITIAL LOADING 2=MAX. LOADING 3=UNLOAD TO ZERO FORCE 4=INITIATION OF RELOAD

NOTE:SPRING RELOADS AT ZERO FORCE(SEQ.1,2,3,4) OR AT FINITE FORCE VALUE(SEQ.1,2,4)

NOTE:INITIAL DEFLECTION IS FIRST IMPACT IF NYPE=1, OTHERWISE IT IS POINT AT WHICH RELOADING OCCUR FOR NYTYPE=4
